Seeking for my Net-Zero Life

Seeking for my Net-Zero Life

Seeking for my Net-Zero Life

Relationship between General and Sectoral Guidance

IPCC Guidelines

- Contents

- Introduction
- Mineral/Chemical/Metal Industry Emissions
- Non-Energy Product from Fuels and Solvent Use
- Electronics Industry Emissions
- Fluorinated Substitutes for Ozone Depleting Substances
- Other Product Manufacture and Use

IPPU, What is it about?

- Greenhouse gas emissions occurring from
 - industrial processes,
 - the use of greenhouse gases in products,
 - non-energy use of fossil fuel carbon.

What is it really about?

- Chemically or physically transform materials .
e.g.:
 - The blast furnace in the iron and steel industry
 - Cement industry
 - Ammonia and other chemical products manufactured from fossil fuels used as chemical feedstock
 - chemically: $\text{NH}_3 + \text{O}_2 = 0.5 \text{N}_2\text{O} \uparrow + 1.5 \text{H}_2\text{O}$ (nitric acid production)
 - physically: $\text{CaCO}_3 + (\text{Heat}) = \text{CaO} + \text{CO}_2 \uparrow$

What is Industrial Process?

- GHG related
- Refrigerators, foams or aerosol cans.
 - HFCs as alternatives to ODS
 - SF₆ used in electrical equipment
 - N₂O used as a propellant in aerosol products in food industry
- End-consumers
 - SF₆ used in running-shoes
 - N₂O used during anesthesia

What is Product Use?

- Old and new refrigerants

Refrigerants as ODS substitutes

Nitrogen used in the Food Industry

Uses of Liquid Nitrogen

- Liquid nitrogen is used in medicine to remove warts and to store donor organs.
- It is also used in the food industry to make ice cream and to quick freeze foods.

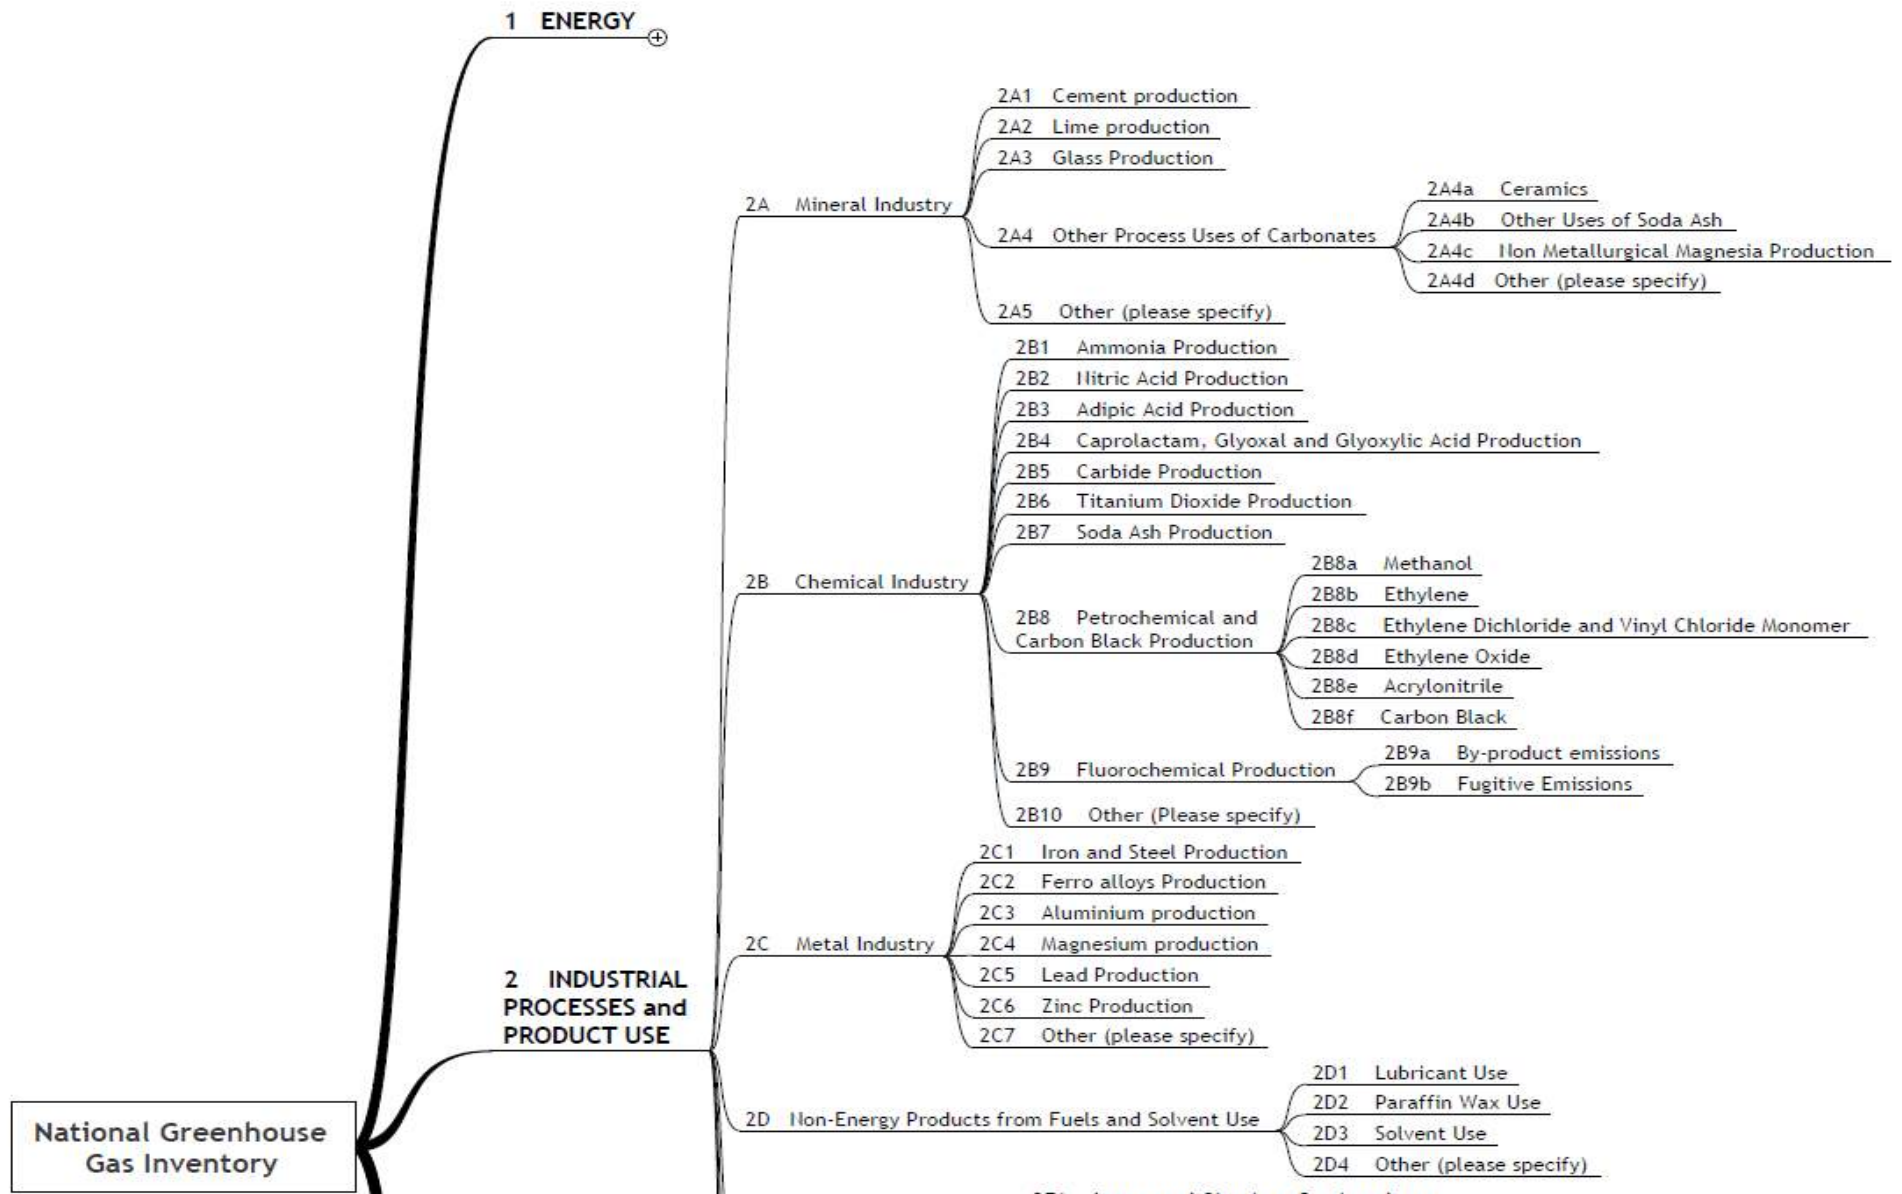

11

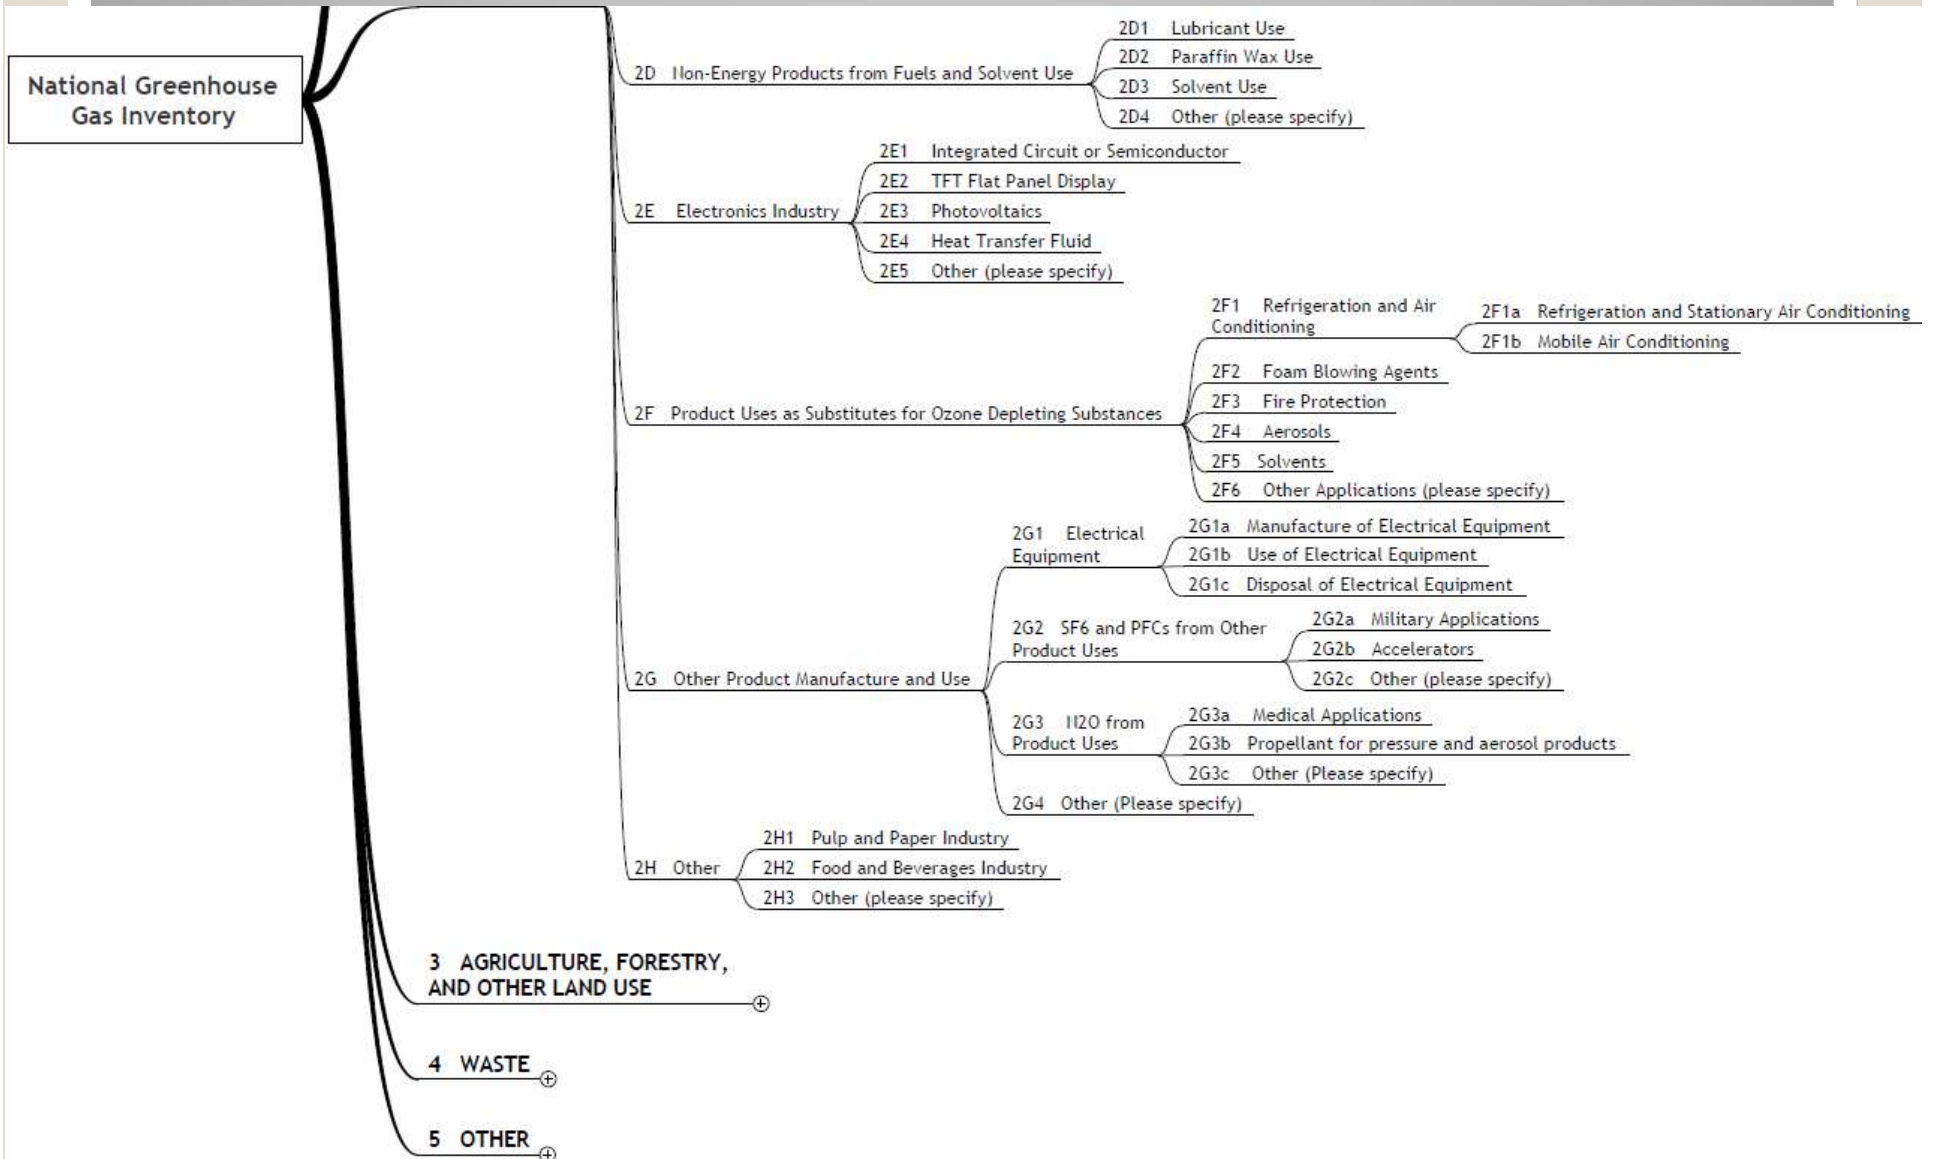

Q. What kinds of main industries does your country have?

Exercise 1

The IPPU Sectors (1/2)

The IPPU Sectors (2/2)

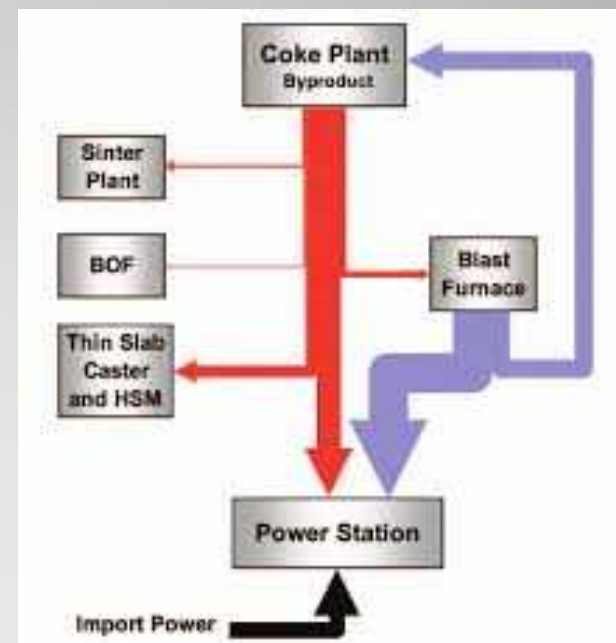

- Allocation / Double Counting
 - by-product fuels or waste gases are transferred from the manufacturing site and combusted elsewhere in quite different activities.
 - to be reported in the IPPU sector or fossil fuel use in an Energy Sector?

The Complicated Issues in IPPU

Example of Allocation Issue – metal industry

<https://youtu.be/otVFD09YSM8>

Steel Manufacturing Process

United Nations
Office for Sustainable Development

- blast furnace
 - Blast furnace gas is combusted entirely within the Iron and Steel industry (whether for heating blast air, site power needs or for metal finishing operations) the associated emissions are reported in the IPPU subcategory 2C1 (Iron and steel production).
 - If part of the gas is delivered to a nearby brick works for heat production or a main electricity producer then reported in subcategory 1A2f or 1A1a. (Energy)

Example of Boundary and Allocation Issue

- Naphtha cracking in petrochemical
 - If surplus methane or hydrogen from the steam cracking of naphtha is **combusted within the petrochemical site** for another process then reported as IPPU, **subcategory 2B8**.
 - If the gases are **passed to a nearby refinery for fuel use**, then reported as **Energy, 1A1b** (Petroleum refining)

Boundary and Allocation

<https://youtu.be/gYnGgre83CI>

Refinery Crude Oil Distillation Process

- Refrigerant in Cars, home & office Air Conditioners?
 - capture and emissions for recovery and use or destruction.
 - good practice to account for capture of emissions using detailed country-specific or more suitably plant-level data.

Capture and Abatement

- Carbon Capture Technology
 - good practice to deduct the GHG captured in a higher tier emission calculation, e.g. **plant level**.
 - emissions from captured in the process may be both combustion- and process-related. Be careful of **double-counting**.
 - capture and storage issues refer to Volume 2, Section 2.3.4

Capture and Abatement

- **Feedstock:** used as raw materials in chemical conversion processes in order to produce primarily organic chemicals and inorganic chemicals and their derivatives.
- **Reductant:** used as reducing agent for the production of various metals and inorganic products.
- **Non-energy product:** refineries and coke ovens produce some non-energy products. Lubricants and greases, paraffin waxes, etc.

What is Non-Energy Use?

- The **mass-balance** approach
 - “I know the beginning and the end”
 - Accountant approach
- The **emission factor** approach
 - “Based on the trend, I can presume”
 - Empirical

GHG Calculation in IPPU

The methods (MB and EF)

- more accurate when emission rate vary across equipment and facilities, or over time.
- consideration
 - accurate activity data for the MB approach should be a available
 - drawbacks: 1. inaccuracy of measuring devices,
 - 2. slow leakage afterwards. i.e. time lag.

Mass-balance(MB) approach

- Using nameplate capacity of the equipment, apparent leak vs actual leak
- Continuing **accuracy** of its EF is the key for robustness and reliability.
 - periodical check of EF is necessary.
- Limitation: EF for ODS substitutes and SF₆ from electrical equipment **do not exist** for all regions of the world.

Emission Factor(EF) approach

- What is my country's electricity EF?

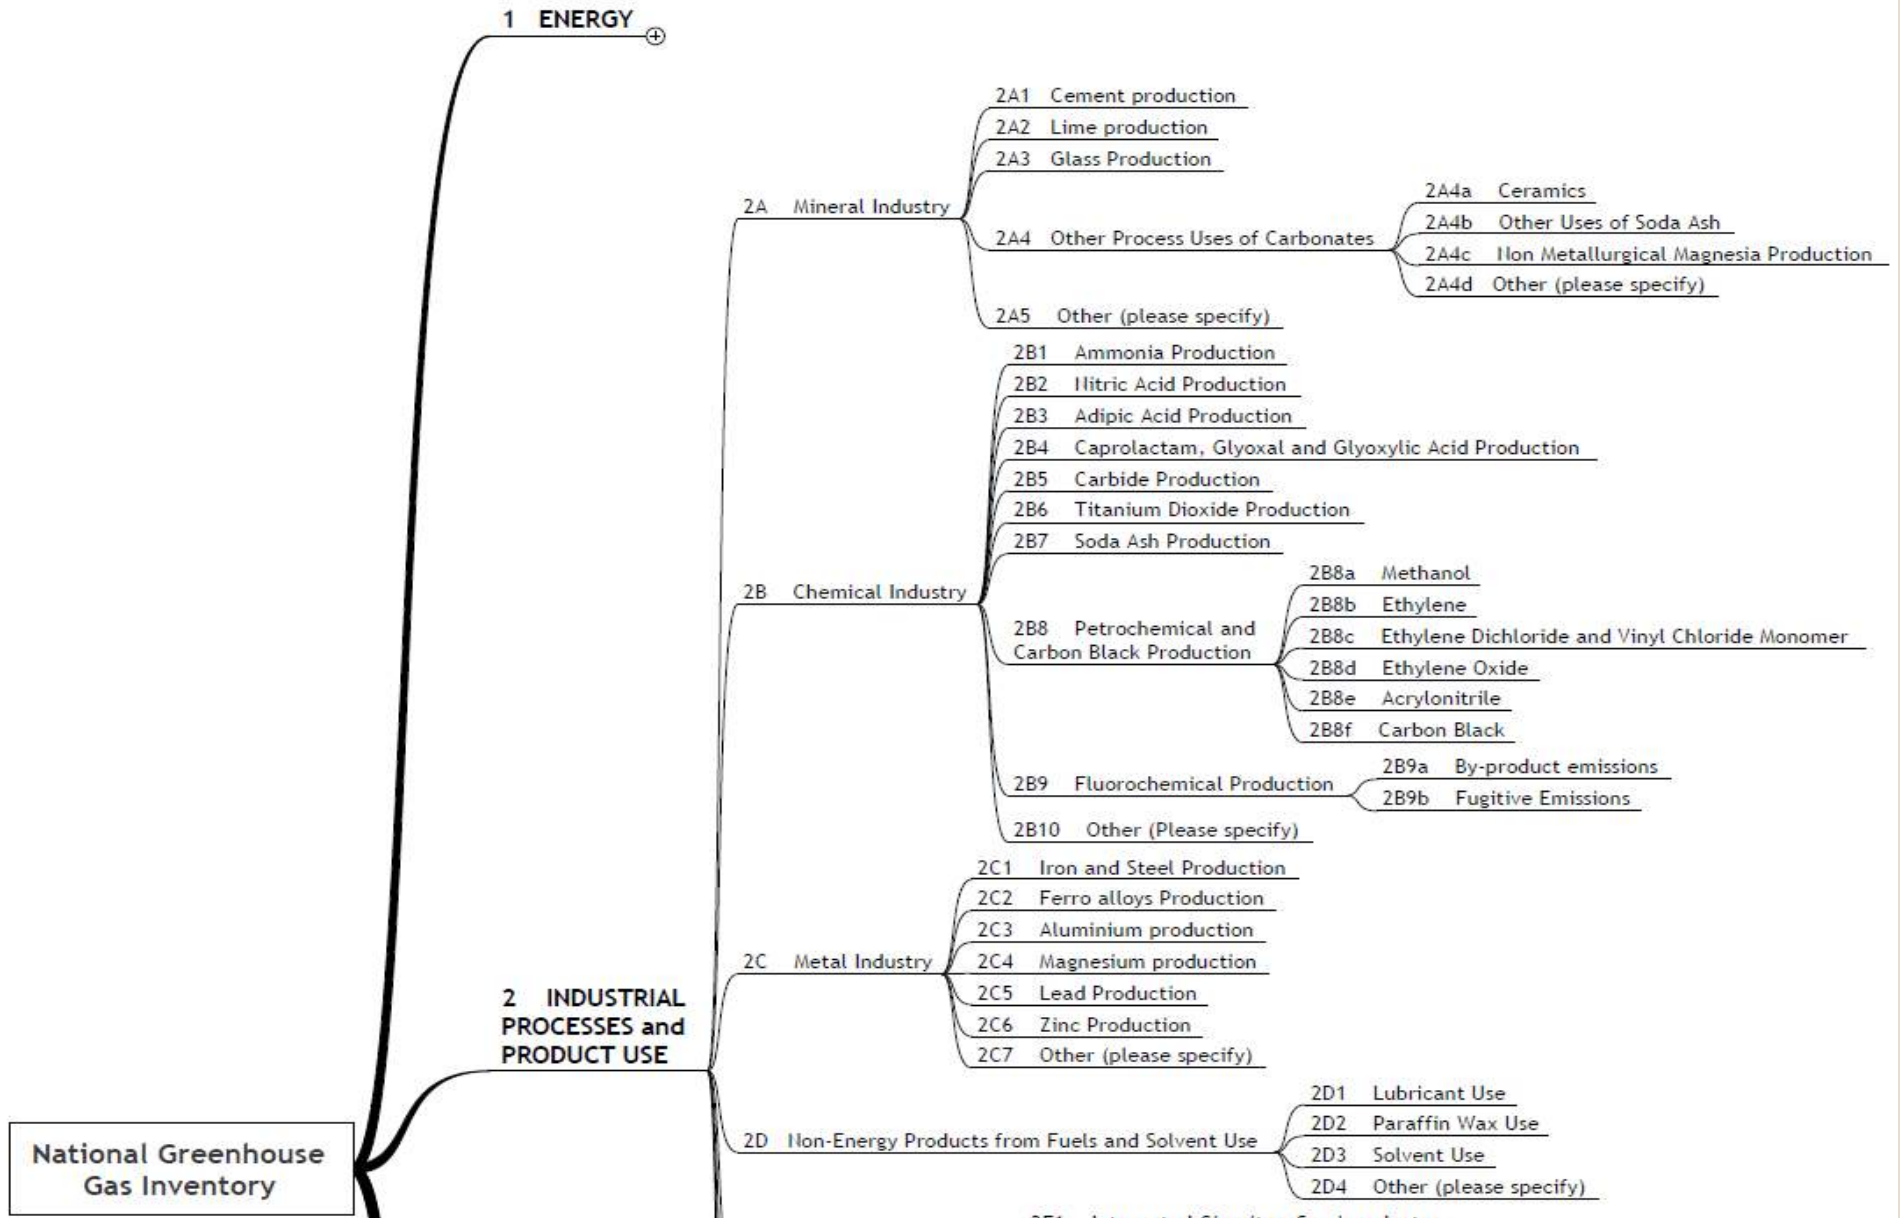

IEA Emission Factors 2022

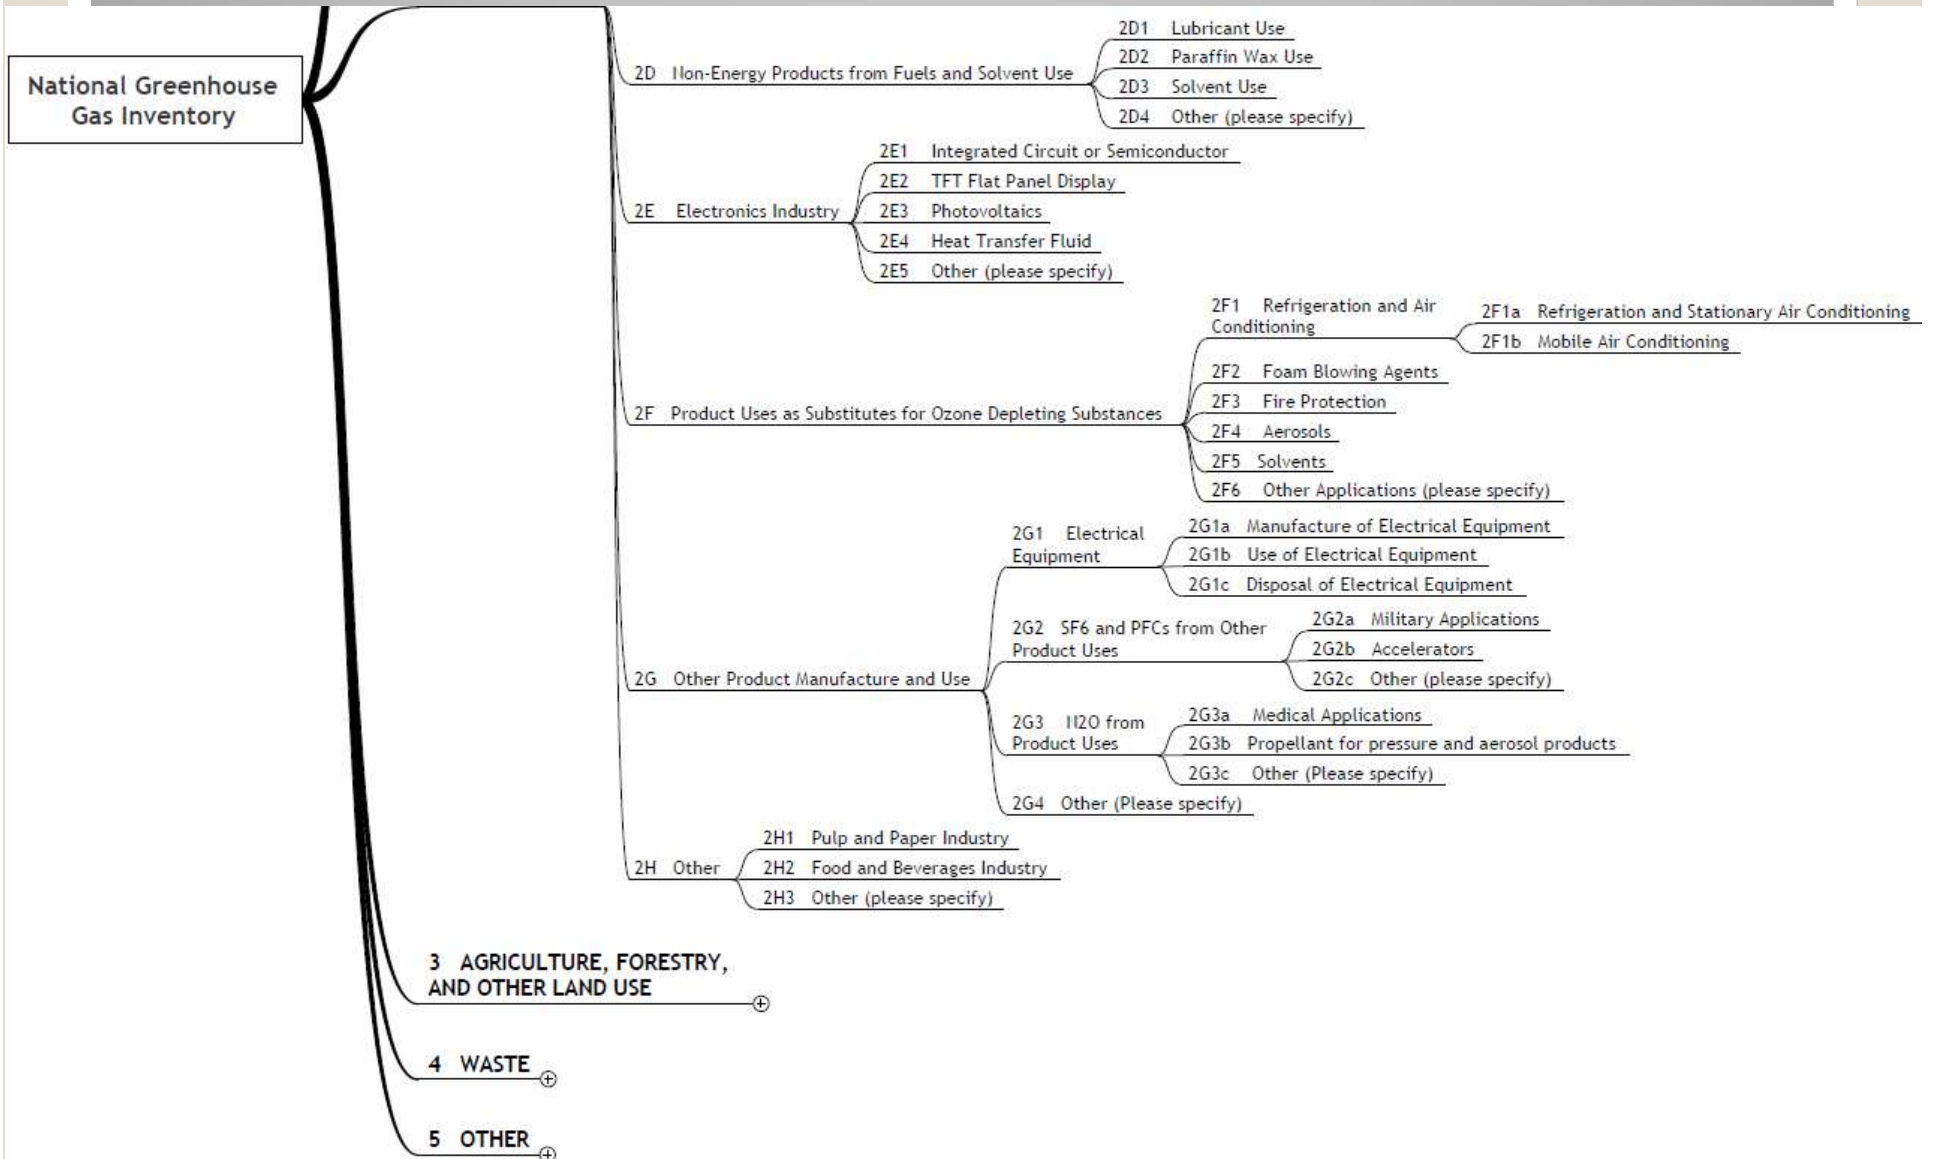

What's included?	Data description
Notes & definition	
CO2 per kWh electricity only	
CO2 per kWh of electricity and heat	<p>This document contains a description of the electricity and heat emissions factors file distributed together with the 2022 edition of the Emission factors data package. This excel file includes excel sheets with a set of carbon emission factors for electricity and electricity/heat generation. The factors are described below:</p> <ul style="list-style-type: none"> • CO2 emission factors for electricity only generation (CHP electricity included) for world countries (in CO2 per kWh, 1990 to 2020). (Sheet CO2KWH ELE) • CO2 emission factors for electricity and heat generation for world countries (in CO2 per kWh, 1990 to 2020). (Sheet CO2 KWH ELE & HEAT)
Trade adjustment	<p>These emission factors are given for electricity and electricity/heat generation for the total electricity generation, and for generation from oil, coal, gas and from non-renewable wastes, as well as from biofuels. (Sheets CO2 KWH ELE & HEAT and CO2KWH ELE)</p>
T&D losses adjustment	<ul style="list-style-type: none"> • 2021 provisional emission factors for electricity and electricity/heat generation, based on provisional electricity generation data (for all OECD countries and selected non-OECD countries). (Sheets CO2 KWH ELE & HEAT and CO2KWH ELE)
CH4 factors	<ul style="list-style-type: none"> • CH4 and N2O emission factors for electricity generation (based on default IPCC factors) (in CO2eq per kWh, 1990 to 2020). (Sheets CH4 factors and N2O factors)
N2O factors	<ul style="list-style-type: none"> • Adjustment factors to emission factors from electricity generation for indirect emissions induced by electricity trade between countries (for OECD countries, 1990 to 2020). (Sheet Trade adjustment)
Summary	<ul style="list-style-type: none"> • Adjustment factors to emission factors from electricity generation for emissions associated to transmission and distribution losses of electricity in the grid (for countries with available data, 1990 to 2020). (Sheet T&D losses adjustment)
	<ul style="list-style-type: none"> • Emission factors by fuel from direct combustion of fuels in other sectors than electricity and heat

IEA – Emission Factors 2022

The IPPU Sectors (1/2)

The IPPU Sectors (2/2)

- It is about Data Accuracy and Data availability.
 - Tier 1
 - Tier 2
 - Tier 3
- Inventory for small and large GHG emitters, which tier is appropriate?

Methodologies – Understanding the Tier

- Tier 1 – average value of the world
- Tier 2 – national statistical value
- Tier 3 – Actual value (Plant specific data)

**Understanding the Tier
(e.g. weight)**

- **Uncertainty Assessment**

- *“Doubt is not a pleasant condition, but certainty is an absurd one.” - Voltaire*

- **Required uncertainty level**

Uncertainty Assessment

Iron & Steel Production GHG calculation– How to?

Total emissions are the sum of Equations 4.4 to 4.8.

EQUATION 4.4
CO₂ EMISSIONS FROM IRON AND STEEL PRODUCTION (TIER 1)
Iron & Steel: $E_{CO_2, non-energy} = BOF \cdot EF_{BOF} + EAF \cdot EF_{EAF} + OHF \cdot EF_{OHF}$

EQUATION 4.5
CO₂ EMISSIONS FROM PRODUCTION OF PIG IRON NOT PROCESSED INTO STEEL (TIER 1)
Pig Iron Production: $E_{CO_2, non-energy} = IP \cdot EF_{IP}$

EQUATION 4.6
CO₂ EMISSIONS FROM PRODUCTION OF DIRECT REDUCED IRON (TIER 1)
Direct Reduced Iron: $E_{CO_2, non-energy} = DRI \cdot EF_{DRI}$

EQUATION 4.7
CO₂ EMISSIONS FROM SINTER PRODUCTION (TIER 1)
Sinter Production: $E_{CO_2, non-energy} = SI \cdot EF_{SI}$

EQUATION 4.8
CO₂ EMISSIONS FROM PELLET PRODUCTION (TIER 1)
Pellet Production: $E_{CO_2, non-energy} = P \cdot EF_P$

Where:

$E_{CO_2, non-energy}$ = emissions of CO₂ to be reported in IPPU Sector, tonnes

BOF= quantity of BOF crude steel produced, tonnes

EAF = quantity of EAF crude steel produced, tonnes

OHF = quantity of OHF crude steel produced, tonnes

IP = quantity of pig iron production not converted to steel, tonnes

DRI = quantity of Direct Reduced Iron produced nationally, tonnes

SI = quantity of sinter produced nationally, tonnes

P = quantity of pellet produced nationally, tonnes

EF_x = emission factor, tonnes CO₂/tonne x produced

Tier 1

Iron & Steel Production GHG calculation– How to?

EQUATION 4.9

CO₂ EMISSIONS FROM IRON & STEEL PRODUCTION (TIER 2)

$$E_{CO_2, non-energy} = \left[PC \cdot C_{PC} + \sum_a (COB_a \cdot C_a) + CI \cdot C_{CI} + L \cdot C_L + D \cdot C_D + CE \cdot C_{CE} + \sum_b (O_b \cdot C_b) + COG \cdot C_{COG} - S \cdot C_S - IP \cdot C_{IP} - BG \cdot C_{BG} \right] \cdot \frac{44}{12}$$

Where, for iron and steel production:

$E_{CO_2, non-energy}$ = emissions of CO₂ to be reported in IPPU Sector, tonnes

PC = quantity of coke consumed in iron and steel production (not including sinter production), tonnes

COB_a = quantity of onsite coke oven by-product *a*, consumed in blast furnace, tonnes

CI = quantity of coal directly injected into blast furnace, tonnes

L = quantity of limestone consumed in iron and steel production, tonnes

D = quantity of dolomite consumed in iron and steel production, tonnes

CE = quantity of carbon electrodes consumed in EAFs, tonnes

O_b = quantity of other carbonaceous and process material *b*, consumed in iron and steel production, such as sinter or waste plastic, tonnes

COG = quantity of coke oven gas consumed in blast furnace in iron and steel production, m³ (or other unit such as tonnes or GJ. Conversion of the unit should be consistent with Volume 2: Energy)

S = quantity of steel produced, tonnes

IP = quantity of iron production not converted to steel, tonnes

BG = quantity of blast furnace gas transferred offsite, m³ (or other unit such as tonnes or GJ. Conversion of the unit should be consistent with Volume 2: Energy)

C_x = carbon content of material input or output *x*, tonnes C/(unit for material *x*) [e.g., tonnes C/tonne]

Iron & Steel Production GHG calculation– How to?

EQUATION 4.10

CO₂ EMISSIONS FROM SINTER PRODUCTION (TIER 2)

$$E_{CO_2, non-energy} = \left[CBR \cdot C_{CBR} + COG \cdot C_{COG} + BG \cdot C_{BG} + \sum_a (PM_a \cdot C_a) - SOG \cdot C_{SOG} \right] \cdot \frac{44}{12}$$

Where, for sinter production:

$E_{CO_2, non-energy}$ = emissions of CO₂ to be reported in IPPU Sector, tonnes

CBR = quantity of purchased and onsite produced coke breeze used for sinter production, tonnes

COG = quantity of coke oven gas consumed in blast furnace in sinter production, m³ (or other unit such as tonnes or GJ. Conversion of the unit should be consistent with Volume 2: Energy)

BG = quantity of blast furnace gas consumed in sinter production, m³ (or other unit such as tonnes or GJ. Conversion of the unit should be consistent with Volume 2: Energy)

PM_a = quantity of other process material *a*, other than those listed as separate terms, such as natural gas, and fuel oil, consumed for coke and sinter production in integrated coke production and iron and steel production facilities, tonnes

SOG = quantity of sinter off gas transferred offsite either to iron and steel production facilities or other facilities, m³ (or other unit such as tonnes or GJ. Conversion of the unit should be consistent with Volume 2: Energy)

C_x = carbon content of material input or output *x*, tonnes C/(unit for material *x*) [e.g., tonnes C/tonne]

Non-energy product use calculation – How to?

TABLE 5.1
NON-ENERGY PRODUCT USES OF FUELS AND OTHER CHEMICAL PRODUCTS

Types of fuels used	Examples of non-energy uses	Gases covered in this chapter	
		CO ₂	NMVOC, CO
Lubricants	Lubricants used in <u>transportation and industry</u> ; Section 5.2	X	
Paraffin waxes	Candles, corrugated boxes, paper coating, board sizing, adhesives, food production, packaging; Section 5.3	X	

EQUATION 5.2
LUBRICANTS – TIER 1 METHOD

$$CO_2 \text{ Emissions} = LC \cdot CC_{Lubricant} \cdot ODU_{Lubricant} \cdot 44/12$$

Where:

CO₂ Emissions = CO₂ emissions from lubricants, tonne CO₂

LC = total lubricant consumption, TJ

CC_{Lubricant} = carbon content of lubricants (default), tonne C/TJ (= kg C/GJ)

ODU_{Lubricant} = ODU factor (based on default composition of oil and grease), fraction

44/12 = mass ratio of CO₂/C

Oxidised During Use

EQUATION 5.2
LUBRICANTS – TIER 1 METHOD

$$CO_2 \text{ Emissions} = LC \cdot CC_{\text{Lubricant}} \cdot ODU_{\text{Lubricant}} \cdot 44/12$$

Where:

CO_2 Emissions = CO_2 emissions from lubricants, tonne CO_2

LC = total lubricant consumption, TJ

$CC_{\text{Lubricant}}$ = carbon content of lubricants (default), tonne C/TJ (= kg C/GJ)

$ODU_{\text{Lubricant}}$ = ODU factor (based on default composition of oil and grease), fraction

44/12 = mass ratio of CO_2/C

For lubricants the default carbon contents factor is 20.0 kg C/GJ on a Lower Heating Value basis. (See Table 1.3 in Chapter 1 of Volume 2).
Note that kg C/GJ is identical to tonne C/TJ.

TABLE 5.2
DEFAULT OXIDATION FRACTIONS FOR LUBRICATING OILS, GREASE AND LUBRICANTS IN GENERAL

Lubricant / type of use	Default fraction in total lubricant ^a (%)	ODU factor
Lubricating oil (motor oil /industrial oils)	90	0.2
Grease	10	0.05
IPCC Default for total lubricants^b		0.2

^a Excluding the use in 2-stroke engines.

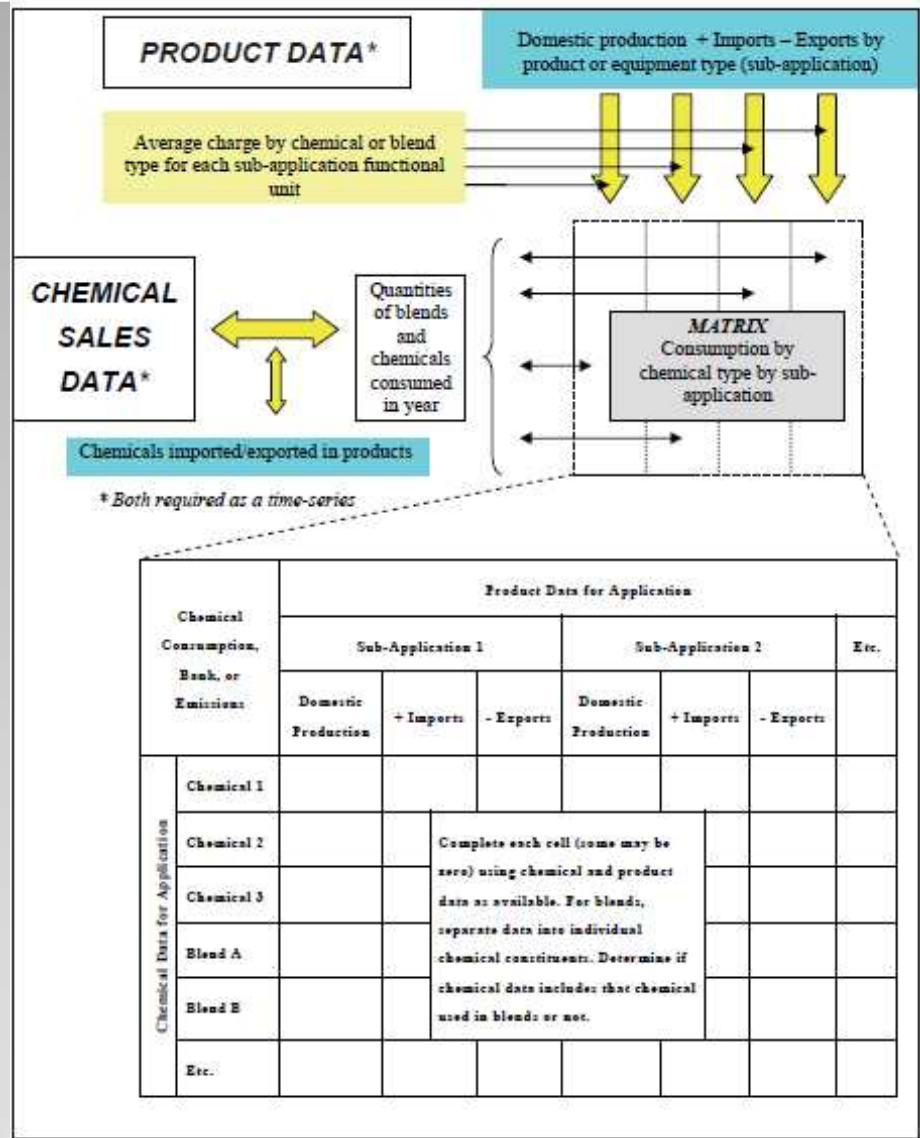

^b Assuming 90 percent lubricating oil consumption and 10 percent grease consumption and rounded to one significant digit.

Source: Rinehart (2000).

Lubricant use calculation – How to?

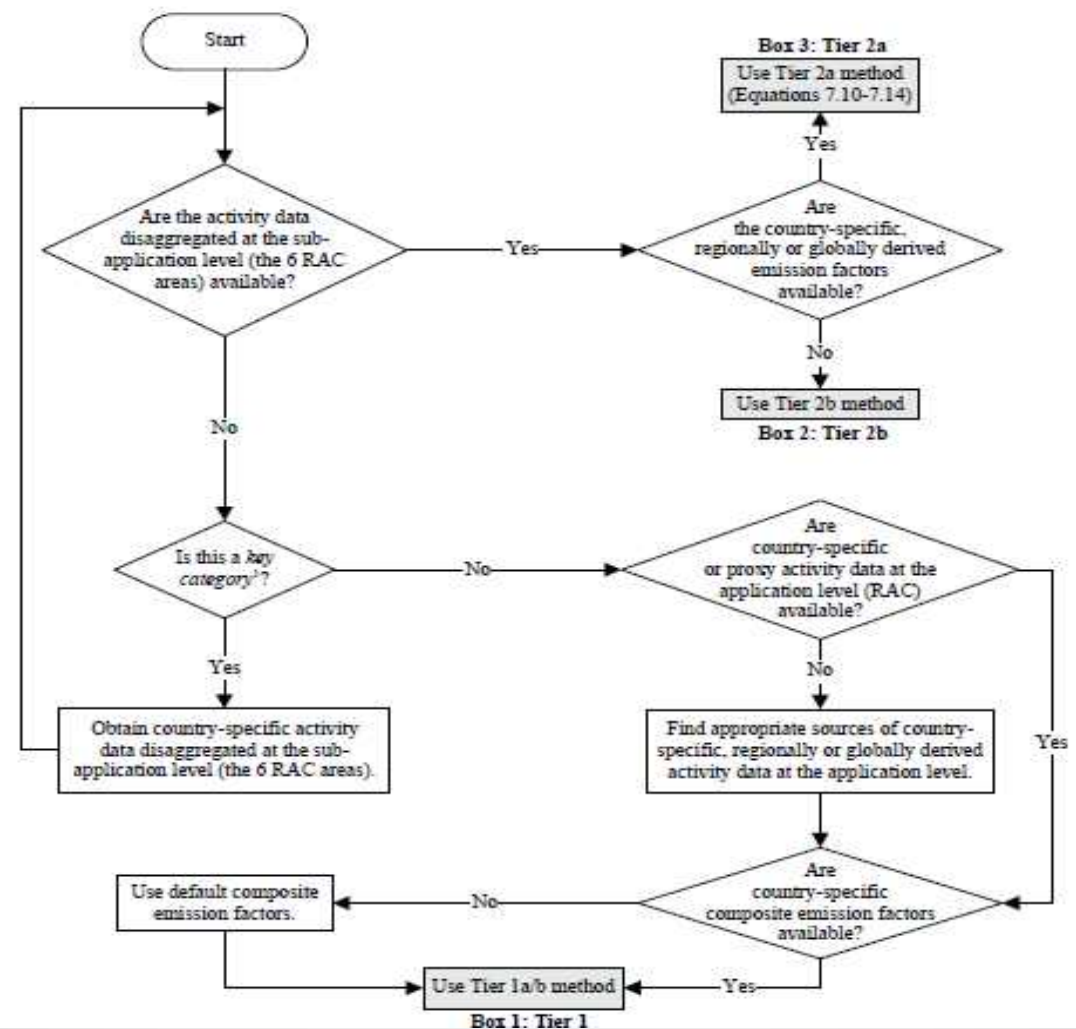

TABLE 7.1
MAIN APPLICATION AREAS FOR HFCs AND PFCs AS ODS SUBSTITUTES¹

Chemical	Refrigeration and Air Conditioning	Fire Suppression and Explosion Protection	Aerosols		Solvent Cleaning	Foam Blowing	Other Applications ²
			Propellants	Solvents			
HFC-23	X	X					
HFC-32	X						
HFC-125	X	X					
HFC-134a	X	X	X			X	X
HFC-143a	X						
HFC-152a	X		X			X	
HFC-227ea	X	X	X			X	X
HFC-236fa	X	X					
HFC-245fa				X		X	
HFC-365mfc				X	X	X	
HFC-43-10mee				X	X		
PFC-14 ³ (CF ₄)		X					
PFC-116 (C ₂ F ₆)							X
PFC-218 (C ₃ F ₈)							
PFC-31-10 (C ₄ F ₁₀)		X					
PFC-51-14 ⁴ (C ₆ F ₁₄)					X		

ODS calculation – How to? General methodology

Figure 7.6 Decision tree for actual emissions from the refrigeration and air conditioning (RAC) application

ODS calculation – How to? Decision tree for Tier

The calculation formula for Net Consumption within the Tier 1a method is as follows:

$$\begin{aligned} & \text{EQUATION 7.1} \\ & \text{CALCULATION OF NET CONSUMPTION OF A CHEMICAL IN A SPECIFIC APPLICATION} \\ & \textit{Net Consumption} = \textit{Production} + \textit{Imports} - \textit{Exports} - \textit{Destruction} \end{aligned}$$

Net Consumption values for each HFC or PFC are then used to calculate annual emissions for applications exhibiting prompt emissions as follows:

$$\begin{aligned} & \text{EQUATION 7.2A} \\ & \text{CALCULATION OF EMISSIONS OF A CHEMICAL FROM A SPECIFIC APPLICATION} \\ & \textit{Annual Emissions} = \textit{Net Consumption} \bullet \textit{Composite EF} \end{aligned}$$

Where:

Net Consumption = net consumption for the application

Composite EF = composite emission factor for the application
